

ABSTRACT OF THE DISCLOSURE

A cordless terminal for connecting to computer  
5 networks and communication and/or information networks,  
suitable for surfing the Internet and remote handling of e-  
mail, being comprised of a reduced sized terminal which  
comprises a motherboard and processor unit, with integrated  
controlling devices of the peripherals and large storage  
10 means for the operating system and user applications. Said  
terminal comprises of a viewing screen having limited  
thickness, for example, LCD-TFT type or similar, onto which  
there is a tactile panel for interaction with the user,  
being the mobile terminal connected a cordless connection  
15 preferably via radio electric or microwave signals, with a  
fixed support module and/or with remote servers. Said fixed  
support module has an electrical supply source joined to  
the electricity network and a modem or similar of telephone  
connection or cable to a remote server network. Said  
20 support is associated to the feeding supply with a charging  
of the batteries, suitable for the recharging of the  
terminal feeding batteries when said terminal is at a  
distance from the support.
